Overview

Welcome to Gundam Assemble!

This fast-paced, tactical miniatures game puts players directly into the cockpits of legendary Mobile Suits from across the Gundam franchise. Build squads of your favorite units before diving into lightning-fast skirmishes—or relive iconic battles through cinematic story scenarios drawn from Gundam's most memorable conflicts. Combine Mobile Suits from across every Gundam era to create unforgettable battles no timeline has seen before.

Each game of Gundam Assemble revolves around a unique scenario. Some are open-ended tactical skirmishes; others recreate pivotal moments from Gundam's vast history. Scenarios define setup and victory conditions—players earn victory points for defeating enemies, capturing key Objectives, and completing mission-specific goals. When the smoke clears, the player with the highest score claims victory!

Setup

Setup for each game of Gundam Assemble is dictated by your chosen scenario. Choose a scenario and follow the instructions below to set up the game.

Before gameplay, each player will build both their squad of units and their accompanying Tactics deck.

1. Place the game board in the center of the play space.

2. Add the following components to the board as indicated by your chosen scenario:

    a. Bases or Carriers.
    b. Garrisons.
    c. Upgrades.
    d. Energy.
    e. Scenario Objectives.
    f. Terrain.

3. Place the following additional components in the play space within reach of all players:

    a. Additional Upgrades.
    b. Status effect tokens.
    c. Energy.
    d. Attack dice.
    e. Objective control tokens.
    f. Other unit or scenario-specific components.

4. Place the Timeline track near the game board.

5. Each player reveals their chosen squad of units and places the corresponding components on their side of the play space. Each unit includes:

    a. A miniature representing that unit on the game board.
    b. A card depicting that unit's stats, weapons, and abilities.
    c. A Timeline token representing that unit on the Timeline track.
    d. Some units will also come with unit-specific tokens or other components.

6. Each player places the Timeline tokens for each of their units on the Timeline track based on each unit's starting Timeline value. If more than one of your units is placed on the same space of the Timeline, stack the tokens on top of each other in your preferred order.

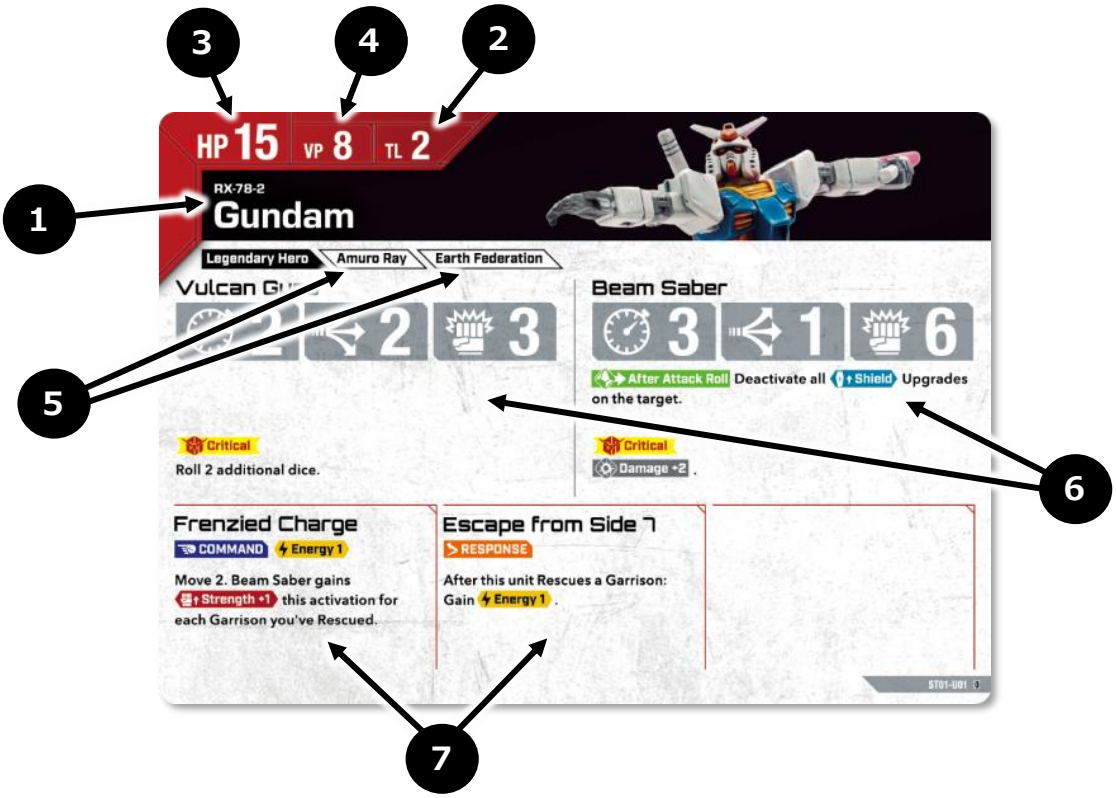

7. The player whose unit(s) has the lowest starting Timeline value will act first. If units belonging to more than one player are tied, each player rolls a single attack die and the player with the higher roll plays first.

8. Each player resolves any setup abilities printed on their unit cards in activation order starting with the first player to act. If a player has multiple setup abilities, resolve each ability in your preferred order.

Card Types

Unit Cards

Mobile Suits are the heart and soul of Gundam Assemble. During their activation, players will maneuver their units to capture or destroy key battlefield Objectives while engaging enemies in combat. Each unit comes with a corresponding unit card depicting its stats, weapons, and abilities.

1. The unit's name and model number.
2. The unit's starting Timeline value, determining where it starts the game on the Timeline track.
3. The unit's hit point value. When a unit's hit points reach zero, it is defeated.
4. The unit's victory point (VP) value. Opponents earn this many victory points when defeating this unit.
5. The unit's traits. These provide additional information about the unit: Its pilot, its faction affiliations, and any unique characteristics. These traits determine the kinds of Tactics cards that can be included when building a squad with this unit, and are referenced by some abilities. Each unit also has a signature title that differentiates it from other units of the same name.
6. The weapons this unit has available during combat.
7. The unit's abilities.

Tactics Cards

In addition to their squad of units, each player begins the game with a deck of nine Tactics cards representing unique attacks, abilities, and strategies they can employ during battle. Players will shuffle their Tactics decks and draw three cards at the beginning of the game.

1. The name of the Tactics card.
2. The card's type. Tactics cards come in three types: Attack, Command, and Response. This affects when the card can be played. See "Cards and Abilities."
    a. Some cards include a Timeline cost that must be paid when playing the card.
    b. Some cards feature the signature title of a specific unit alongside their type. These cards can only be played by a unit with the matching title.
3. The effect of the card when played.
4. Some Tactics cards specify a faction for deck building, meaning the card can only be included in squads that include at least one unit from the matching faction.
    a. Cards that don't specify a faction or named character have no deck building requirements. See "Squad and Deck Building."

Gameplay

Object of the Game

Games of Gundam Assemble consist of two Phases, each including 10 rounds, for a total of 20 rounds per game. Players will activate their units during each round to capture or defend Objectives, complete scenario-specific goals, and—of course—defeat enemy Mobile Suits.

Players will earn victory points throughout the course of the game by defeating enemy units and Garrisons, rescuing allied Garrisons, and by completing scenario goals. The player with the most victory points at the end of a game is considered the winner.

The Timeline (TL) System

Games of Gundam Assemble revolve around the Timeline system. This system represents the passage of time during battle and determines when players are able to activate their units. Understanding how units interact with the Timeline is key to managing gameplay. Your time during each game is limited, and careful management of your Timeline will dramatically improve your odds of victory.

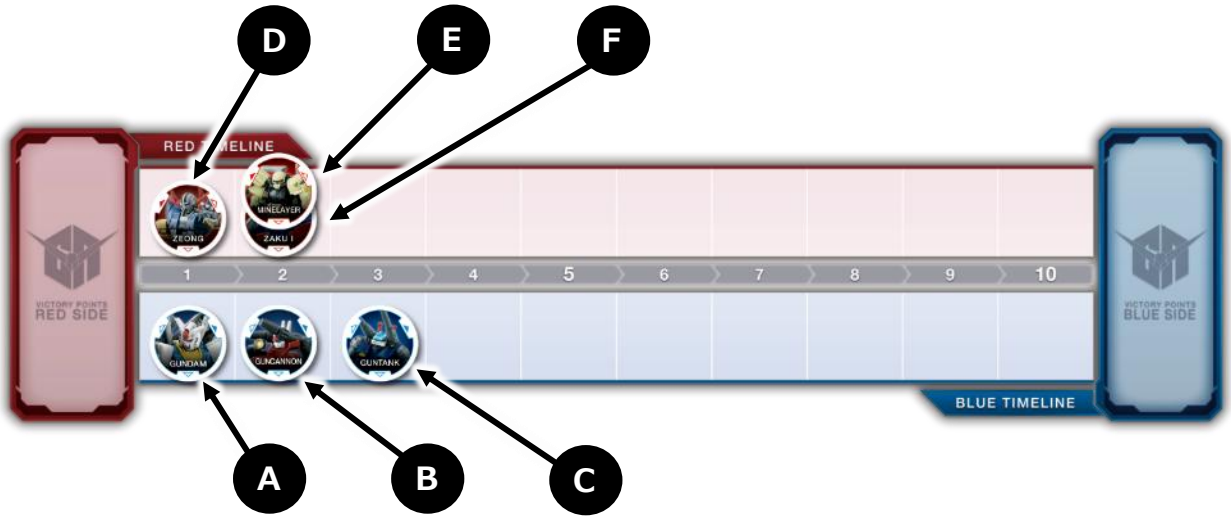

The Timeline Track

The Timeline track consists of 10 spaces representing the 10 rounds of a Phase. Players begin the game by placing a Timeline token on this track for each of their units. Units will move up the Timeline as they're activated.

The Timeline track is divided into two sides: one for each player. Be sure to add Timeline tokens to your side of the track.

Setting up the Timeline track

Players will place a Timeline token on the track for each of their units at the start of the game, based on each unit's starting Timeline value. If more than one of your units is placed on the same space of the Timeline, stack the tokens on top of each other in your preferred order. Units on top of the stack will act before units underneath.

Player A has built a squad featuring the RX-78-2 Gundam (A), the RX-77-2 Guncannon (B), and the RX-75 Guntank (C), while player B is using Zeong (D), a Zaku II: Minelayer (E), and an MS-05B Zaku I (F).

Player A begins by placing each of their Timeline tokens on the Timeline track based on each unit's starting Timeline value. In this case, they have one unit each starting on spaces one, two, and three of the Timeline.

Player B begins the game similarly. They have two units with a starting Timeline value of two, however, so they stack the corresponding Timeline tokens in whatever order they prefer. Here, they've put the Zaku II: Minelayer on top of the Zaku I, meaning that the Minelayer will be activated before the Zaku I.

The game begins with the player whose unit(s) has the lowest starting Timeline value. In this instance, both players have a unit with a starting Timeline value of one, so they each roll one attack die and the player with the higher roll will play first.

Progressing Through the Timeline

Players will activate their units while progressing forward through the Timeline. Gameplay begins with round one of the first Phase, represented by the first space on the Timeline track. For each space on the Timeline track, you will activate any units on that space before moving to the next space (i.e. all units on Timeline 1 must be activated before moving to Timeline 2). If there are no units on a given space on the Timeline, skip that space.

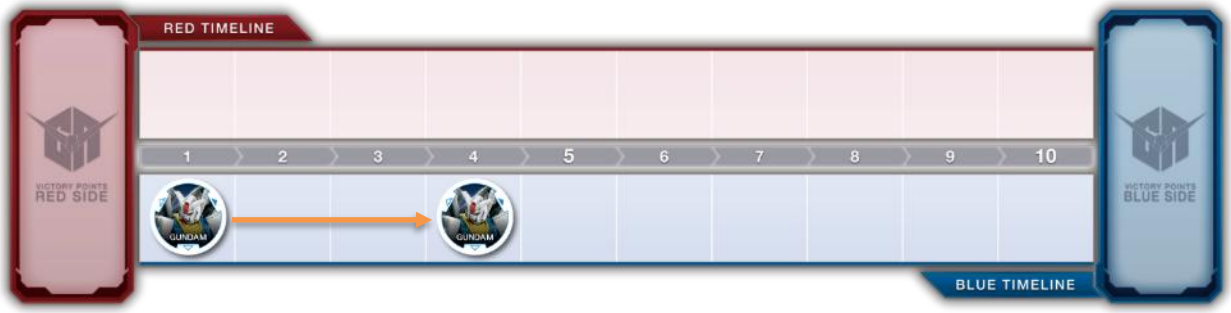

If the same player has multiple units on the same space of the Timeline, they must activate the unit on top of their stack first. If multiple players have units on the same space of the Timeline,

alternate activating units with the player who acted most recently acting last. If this occurs during the first activation of the game, each player rolls one attack die and the player with the higher roll plays first.

After completing round 10, the Phase is over and players will begin the next Phase starting again at round one. Games typically end after two Phases.

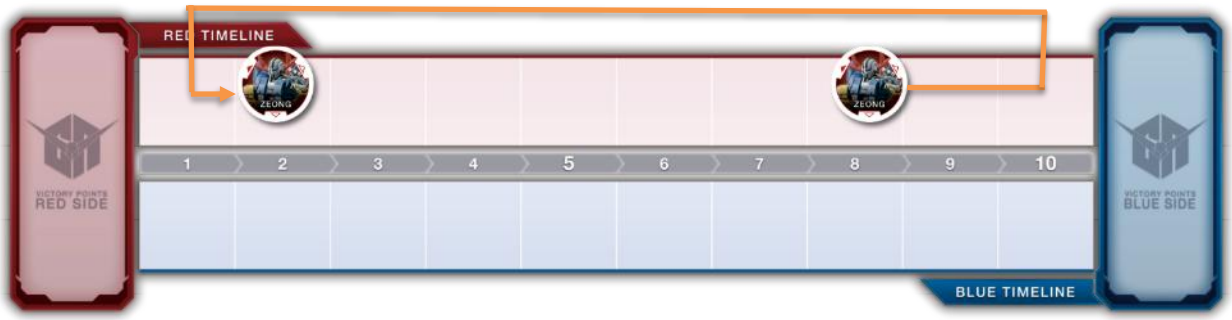

Timeline Costs

Most of the actions you'll take while activating a unit have a Timeline (TL) cost representing the time it takes to complete that action. When taking an action with a TL cost, you must pay that cost by moving that unit's Timeline token forward on the Timeline a number of spaces equal to the cost of your chosen action. Timeline costs are paid immediately after declaring your action, before the action is resolved.

It's Player A's turn to activate the RX-78-2 Gundam. They choose to attack Zeong with the Gundam's Beam Saber. The Gundam's Beam Saber attack has a TL cost of three. As part of making this attack, Player A will move the Gundam's Timeline token three spaces forward on the Timeline track. This means that the Gundam won't be able to act again until round four of the current Phase.

If a TL cost would cause you to move a Timeline token beyond the 10th space of the Timeline track, advance the token to space 10 and then return the token to space one of the track and continue moving the token forward until the full TL cost is paid.

Player B is activating Zeong during round eight of the first Phase. In retaliation for the Gundam's Beam Saber attack earlier in the round, player B positions Zeong to fire his Arm Mega Particle Cannon, which has a TL cost of four. Player B advances the Timeline token for Zeong two spaces forward to space 10 on the Timeline track. Because this does not cover the full TL cost of their chosen action, they must move Zeong's Timeline token back to space one of the track and continue counting. Player B advances Zeong's Timeline token to space two of the Timeline track to pay the remaining two TL cost of attacking with the Arm Mega Particle Cannon.

If a unit spends more than 10 TL in a single activation, that unit advances into the next Phase and won't act again until the next Phase of the game.

If paying a TL cost places your Timeline token on the same space as other allied units, stack your Timeline token on the bottom of any tokens already present.

Ending a Phase

When players have finished activating any units that act during round 10 of the current Phase (or when there are no more tokens present on any rounds in the current Phase), the Phase ends.

- If this is the first Phase of the game:
    - Resolve any scenario Objectives that correspond to the first Phase and score the appropriate number of victory points.
    - Draw three new Tactics cards from your deck.
    - Begin the second Phase.

- If this is the second Phase of the game:
    - Resolve any scenario Objectives that correspond to the second Phase and score the appropriate number of victory points.
    - Compare victory point totals and determine the winner.

Deploying your Units

Players begin the game with their units in their Reserve, rather than on the game board. The first time you activate a unit, you'll deploy it to the board before taking actions. All units deploy from their corresponding Base or Carrier depending on the scenario.

When you deploy a unit, add it to the board on the same hex as your Base—or adjacent to the middle hex of your Carrier—and activate it immediately. Deployed units (and units in general) cannot end their movement on a Base; they must move at least one hex before ending their activation.

There may be rare situations in which you need to deploy a unit and your deployment hexes are blocked by enemies or otherwise inaccessible. In these cases, choose a hex you could normally deploy on, treat that hex as though it were empty, deploy your unit as normal, and immediately Advance to a legal hex. In the event there is both nowhere to deploy to and no legal hex to Advance to once deployed, the unit you wish to deploy must spend 2 Timeline to Energize and will remain in your Reserve until its next activation.

Units will be removed from the board and returned to your Reserve when defeated. The next time you activate a defeated unit, you'll redeploy it as described above. Some abilities specifically affect how a unit redeploys. These abilities do not affect the first time you deploy the unit.

Units awaiting deployment are in your Reserve until they deploy. Units in your Reserve cannot be targeted by attacks and cannot gain status effects, and some of the effects printed on those units may not be active until they are deployed.

Activating your Units

When you begin a round containing one or more of your units, you'll have an opportunity to activate those units. When activating a unit, you must take one Primary Action and may take other actions as defined below.

Advance

Advancing is a unit's basic move action. When a unit Advances, it may move up to three hexes. Terrain and enemies will impact movement. See "Movement Modifiers." Some cards and abilities will also allow a unit to Advance or to take other movement actions. These effects are in addition to a unit's normal Advance action.

You Must Choose one Primary Action

Attack

Spend the indicated TL to make an attack with one of the unit's equipped weapons, or with a weapon provided by a Tactics card.

Dash

Spend two TL to move up to two hexes. Terrain and enemies will impact movement.

Energize

Spend two TL to gain an Energy by placing an Energy token on the appropriate unit card. Units can have multiple Energy at a time.

Rescue

Spend two TL to Rescue an adjacent allied Garrison and score two victory points.

Additional Actions

Many abilities allow units to take additional actions, allowing them to take multiple Primary Actions in the same activation. Typically, units can take one additional action of the type specified by the effect for each use of an ability that allows additional actions.

Actions that have their Timeline cost reduced to 0 by an ability are also considered additional actions of their type. A unit that Dashes at Timeline 0, for example, is considered to be making an additional Dash and has not used up their Primary Action for that activation.

Use Command Abilities

You may use each Command ability once.

Play a Tactics Card

Players may play up to one Tactics card per activation. Each type of Tactics card has specific rules dictating when it can be played. See “Cards and Abilities.”

Moving

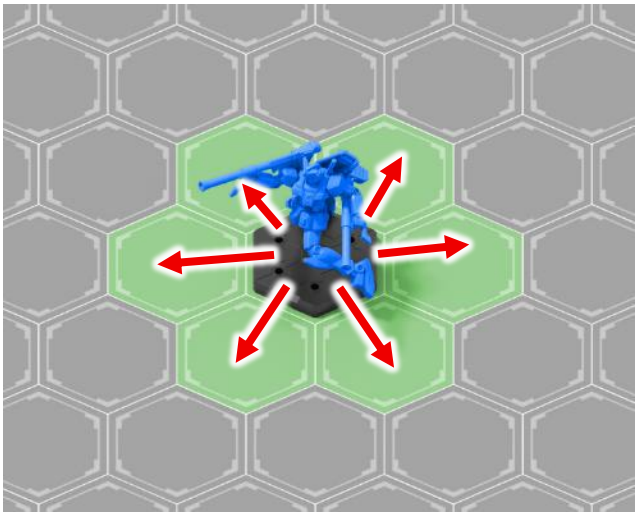

To move a unit, move it one hex in any direction from its current position. Continue to move forward one hex at a time until you’ve moved your maximum distance or you wish to end your movement. You may end your movement at any point during the move; you do not need to move your full allowable distance. If you choose to move, you may not end your movement in the same hex where you started.

You may not move through hexes containing enemy units, enemy Garrisons, enemy Carriers, or enemy structures (such as Bases) but you may move through hexes containing allies or allied structures. You may not end your movement in the same hex as another enemy, ally, or structure unless otherwise specified.

You may not take other actions during your movement. For example: you cannot move one hex, make an attack, and then resume moving. You must complete your movement before taking another action.

For units that occupy multiple hexes, all hexes belonging to the unit must be at the same elevation when ending any move action.

All movement is optional and any movement can be ended before moving the full allowable distance.

Player A intends to move the RX-78-2 Gundam during their next activation. The Gundam can move one hex in any direction, and will continue moving one hex at a time until it reaches its maximum distance or wishes to end its movement. It cannot end its movement in the same hex where it started.

Movement Modifiers

Movement may be affected by many factors, including the following.

Speed Increases

Units can gain Speed by using abilities or collecting Speed Upgrades. These bonuses increase how far a unit can move when Advancing. Each point of Speed bonus allows a unit to move up to one additional hex.

Speed only affects a unit's Advance action. It has no impact on Dashing or other types of movement.

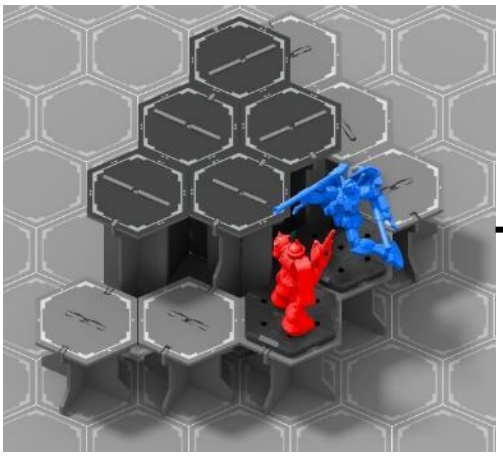

Engagement

While a unit is adjacent to an enemy unit or Garrison at the same elevation, that unit is considered Engaged.

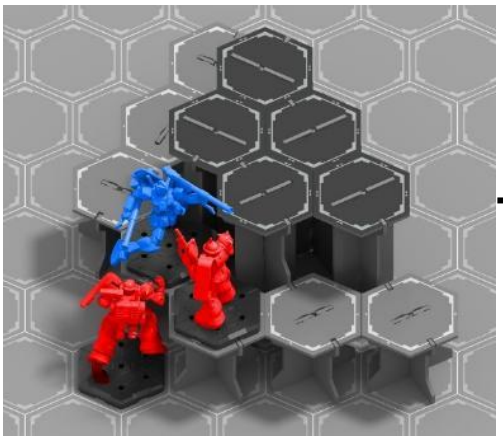

- Units receive a -1 hex penalty to all movement initiated while Engaged.

- An Engaged unit must target at least one of the enemies it's Engaged with when making any attack.

Once a unit is no longer adjacent to an enemy at the same elevation, it is no longer Engaged. Some effects allow a unit to ignore Engagement. These effects allow the unit to ignore both the movement penalty and the attack restriction caused by being Engaged.

Here the RX-78-2 Gundam and Char's Zaku II are adjacent to each other and on the same elevation, so they are considered Engaged. They may attack each other, but may not attack other units while they remain Engaged. Moving with either unit will require one additional movement.

Here the RX-78-2 Gundam is adjacent to both Char's Zaku II and the Zaku II: Minelayer, but the Minelayer is at a lower elevation. The Gundam is only considered Engaged with Char's Zaku II. Even though the Minelayer is adjacent, the Gundam cannot declare an attack against it while Engaged with Char's Zaku II.

Elevation

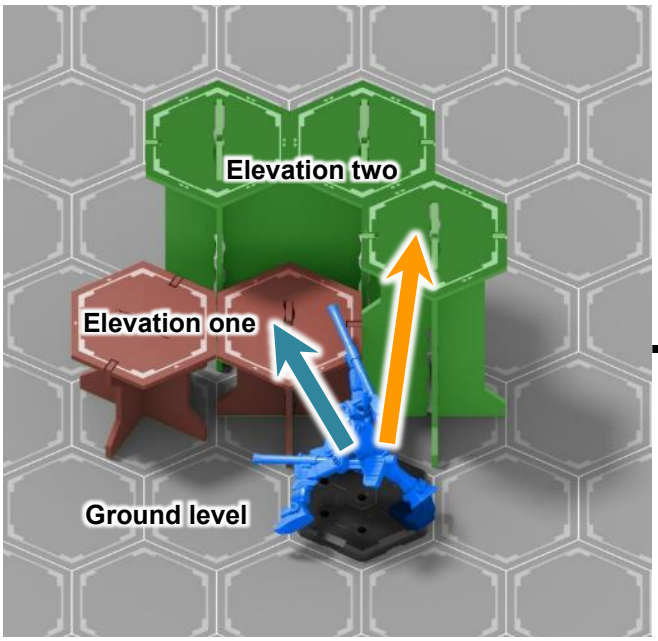

Many scenarios in Gundam Assemble feature terrain at differing elevations. The lowest level of elevation on a map is considered **ground level.** Each higher level of elevation is numbered in relation to ground level. So terrain that is one level higher than ground level is considered height one, while terrain that is two levels higher is considered height two, and so on.

When moving to a hex at a higher elevation, units must spend one additional hex of movement for each level of elevation gained.

When moving from ground level to height one, for example, a unit spends two movement to move one hex. Moving from height one to height two likewise takes an additional movement, and moving straight from ground level to height two requires two extra movement.

Any unit that cannot pay the additional movement required to move to a higher elevation is unable to move to that elevation.

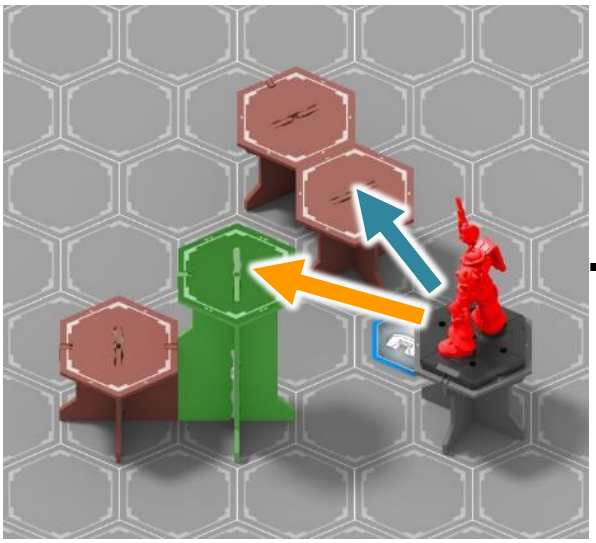

Moving to a lower elevation has no penalty and requires no additional movement.

The RX-78-2 Gundam is currently at ground level. To move onto the brown terrain at elevation one would cost two movement, after which it would take another two movement to move from elevation one to the green terrain at elevation two. Moving directly from ground level to the green terrain at elevation two would cost a total of three movement.

Jumping

Units on elevated terrain jump while moving. When a unit begins a move action while on elevated terrain, their current elevation is considered their starting elevation for the duration of their movement. This allows units to move across gaps in terrain or over enemies at lower elevations. When jumping, a unit may ignore enemies at lower elevations and only spends additional movement if moving to a higher elevation than their starting elevation. Units cannot jump while at ground level. Jumping does not require an additional action; it is part of moving.

Char's Zaku II begins a move while on elevated terrain, which allows it to jump. In this instance, Char's Zaku II can follow the blue path and move to another hex at the same elevation with no movement modifiers. This also allows it to move over the enemy Garrison below. This would cost two movement, for moving two hexes.

Alternatively, it could follow the orange path to move from its current elevation to a higher elevation. This would cost a total of three movement: two for moving two hexes, and a third for going up one level of elevation.

Terrain

Moving through water and other unique terrain will slow units down. Each type of terrain works a little differently. See "Elevation and Terrain."

Attacking

Defeating enemy Mobile Suits is a dominant theme throughout the Gundam franchise and a pivotal piece of Gundam Assemble. Players will position their units to attack enemies to remove them from the board and to gain victory points. Players will follow the steps below when making an attack.

Declare an Attack

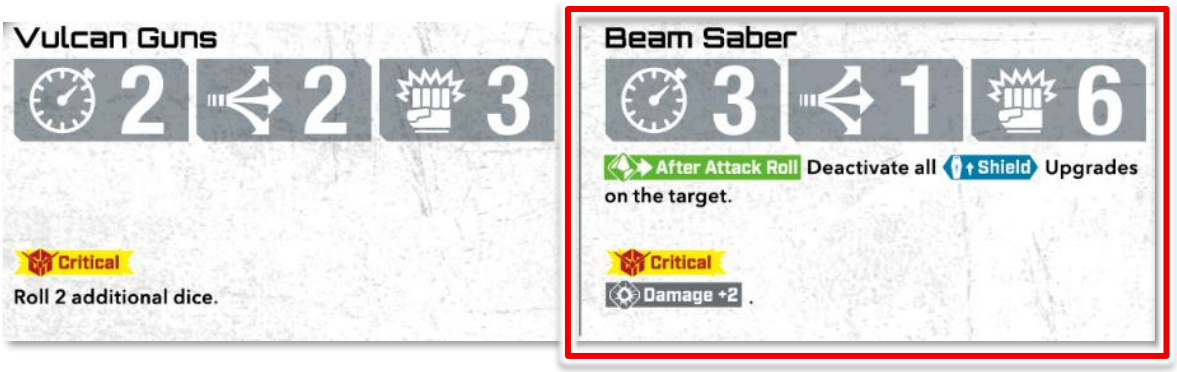

Players must declare their intent to attack at the outset by announcing both the target of their attack and the weapon they'll be using. This starts the attack sequence. Players must use any desired abilities before the attack starts, as many abilities cannot be used during an attack.

Choose a Weapon

Each unit is equipped with one or more iconic weapons, each of which has the following attributes:

- **TL Cost:** This is the number of spaces the unit's Timeline token will be moved forward on the Timeline track as part of making this attack.
- **Range:** This value indicates the maximum range of the weapon.
- **Strength:** This value indicates the number of attack dice the player will roll when making an attack with this weapon.

- **Weapon Effects:** Some weapons, like the Beam Saber pictured here, have persistent effects that trigger each time the weapon is used for an attack.
- **Critical Hit Effects:** Each weapon also has a special effect that triggers when a player rolls a critical hit while using that weapon.

Choose a Target

Players can only attack enemies that are both in range and within Line of Sight.

Range

Each weapon has a range value indicating how far its attacks can reach. Weapons with a range of 1 may only be used against adjacent targets. Weapons with a range of 2 or greater may be used to attack enemies a number of hexes away up to the weapon's maximum range.

Any ranged weapons or abilities also require you to have Line of Sight to the target. Elevation and terrain do not affect the range to your target, but they may affect Line of Sight.

Within Range [x] versus Within [x] Hexes

All attacks and abilities with a stated range require a player to also have Line of Sight, as noted above. Abilities that affect targets "within [x] hexes" do not require Line of Sight.

Line of Sight

When making an attack or using an ability at range 2 or greater, units must have a clear Line of Sight to their target. **Line of Sight does not apply to attacks or abilities that target adjacent allies or enemies.**

To determine Line of Sight, draw an imaginary line from the center of the hex containing the acting unit to the center of the hex containing the target. If necessary, you may use a ruler or other straightedge to draw this line.

The results of the line drawn will vary depending on the elevation of the units involved.

Line of Sight is blocked in any of the following situations:

- The line drawn passes through a piece of terrain at a higher elevation than both the attacker and the target.
- The line drawn passes through enemies other than the target who are at the same elevation as both the attacker and the target.
- The line drawn passes through an enemy structure, such as a Base, that is at the same elevation as both the attacker and the target.

When the acting unit and its target are at different elevations, Line of Sight is also blocked if:

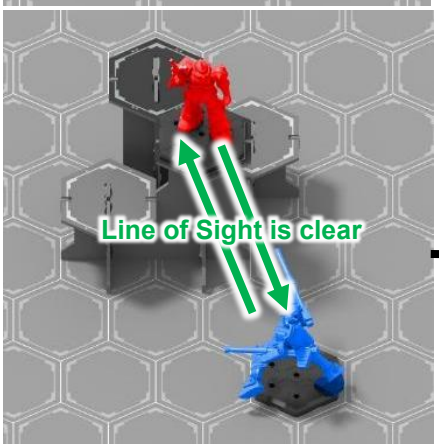

- The line drawn passes through a piece of terrain or an enemy (or enemy structure) other than the target at an elevation equal to whichever unit is on higher ground.

If none of the above scenarios are true, then Line of Sight is clear and the attack or ability can proceed.

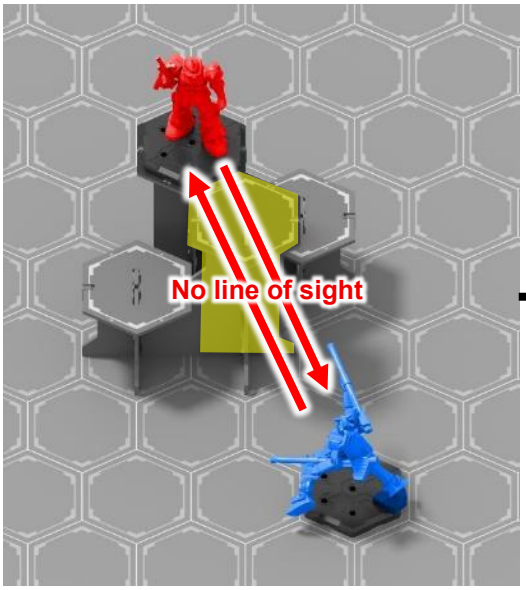

In any scenario in which the line drawn passes exactly between two hexes, the acting player chooses which of the two hexes to use in determining Line of Sight.

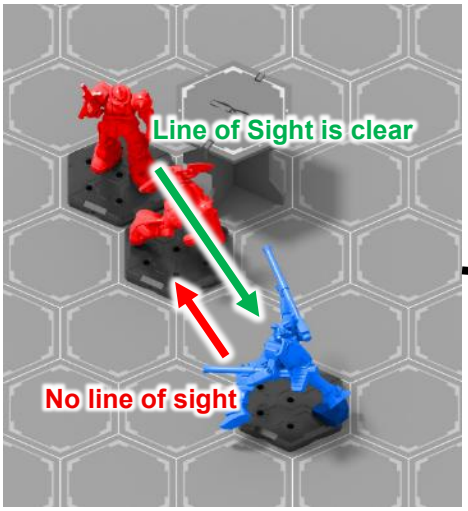

In this example, Line of Sight is blocked for both units, as the line drawn passes through terrain with a higher elevation than either unit.

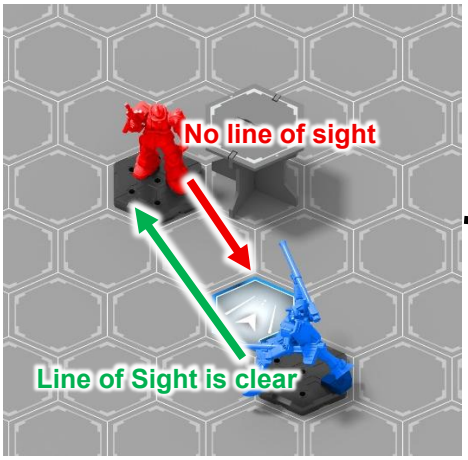

In this example, Line of Sight is clear for both units. While Char's Zaku II is on elevated terrain, the line drawn does not pass through terrain at a higher elevation than the RX-78-2 Gundam, or through terrain at an equal or higher elevation to Char's Zaku II.

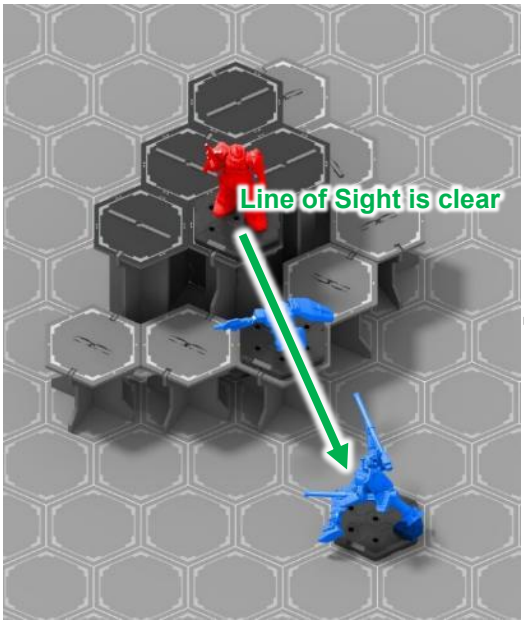

In this example, Line of Sight is blocked for both units. The line drawn passes through terrain at a higher elevation than the RX-78-2 Gundam, and through terrain at an equal elevation to Char's Zaku II.

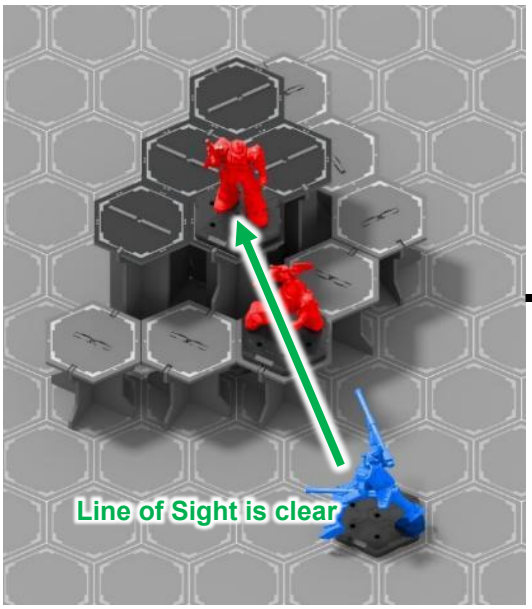

In these examples, Line of Sight is clear for one unit but blocked for the other, as the line drawn passes through either a unit or structure belonging to the opposing player. Char's Zaku II can shoot through the Zaku II: Minelayer but RX-78-2 Gundam can't, while Gundam can shoot through an allied Base but Char's Zaku II can't.

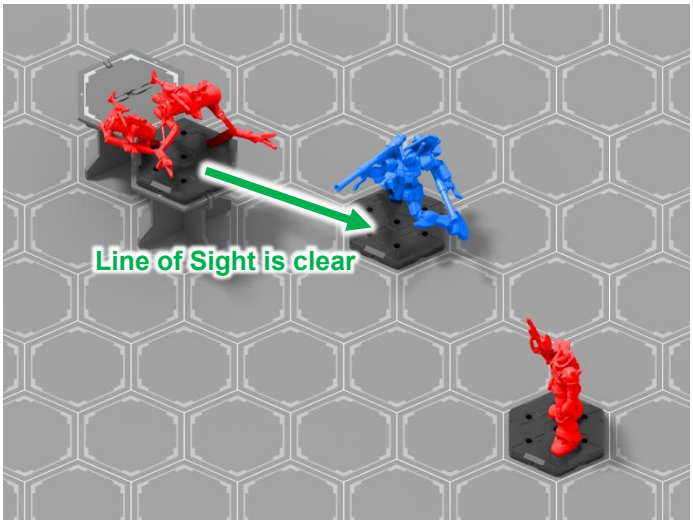

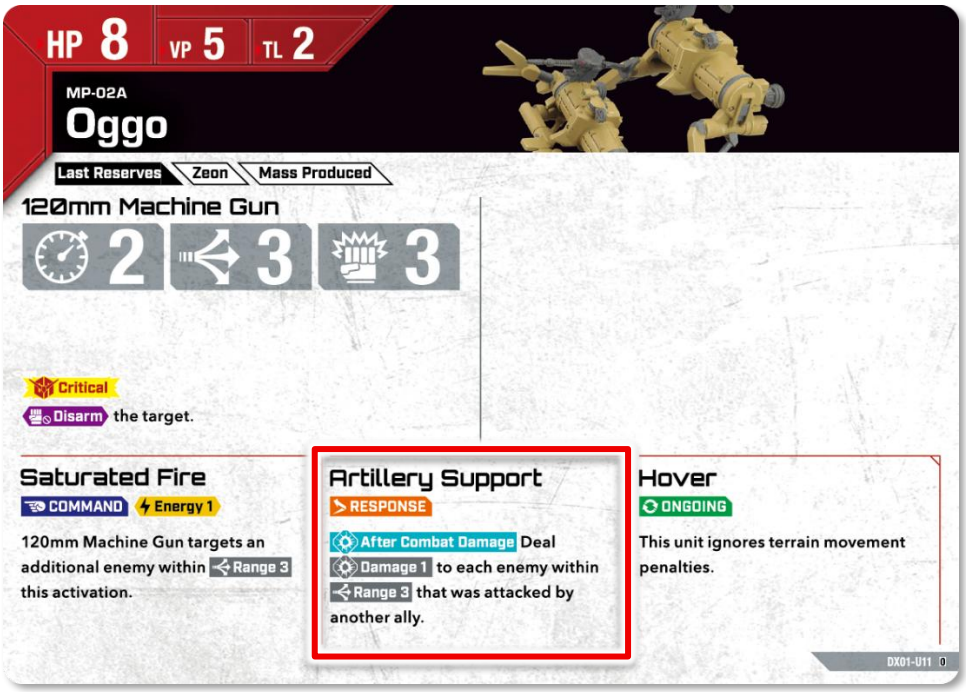

In this example, Char's Zaku II is able to target the RX-78-2 Gundam at ground level, even though the RGM-79 GM is between Char's Zaku II and his target. Because the RGM-79 GM is not at the same elevation as Char's Zaku II, Char's Zaku II can shoot over it.

In this example, the RX-78-2 Gundam is able to attack Char's Zaku II even though Char's Zaku II has an ally between the RX-78-2 Gundam and its target. Because the ally in this example is on a lower elevation, the RX-78-2 Gundam can shoot over it.

Some abilities require their target to be within a certain range in order to be eligible to receive an effect. These abilities require Line of Sight in addition to the stated range.

Player A has positioned their MP-02A Oggo to provide firing support to Char's Zaku II. The MP-02A Oggo's "Artillery Support" ability allows it to deal damage to enemy units attacked by it's allies. In the example, the MP-02A Oggo must have Line of Sight to the RX-78-2 Gundam in order to deal damage to the RX-78-2 Gundam in Response to Char's Zaku II's attack. Note that the MP-02A Oggo does not need to have Line of Sight to Char's Zaku II, as it is specifically the enemy unit that must be in range, not the other allied units.

Ignoring Line of Sight

Some weapons and abilities ignore the usual Line of Sight rules. When using these weapons or abilities, players must still determine if their target is in range, but do not need to factor in the Line of Sight. As such, these attacks and abilities can target units on the other side of elevated terrain or hiding behind other units.

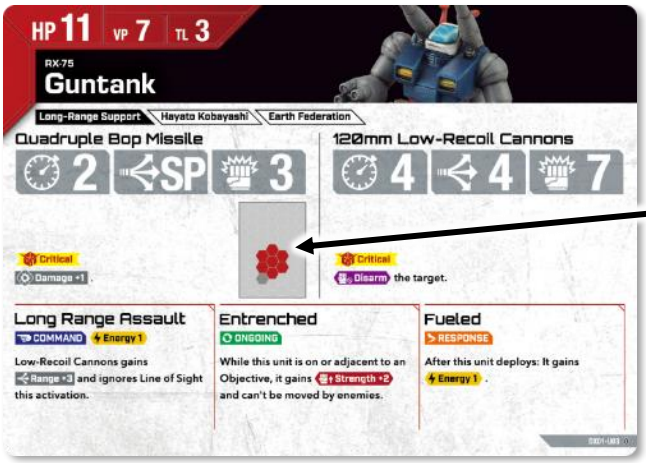

Area of Effect Attacks

Some units feature weapons that target all enemies within a specified area, called an area of effect (AoE). These weapons are accompanied by a diagram indicating the position of the attacking unit and the pattern of hexes affected by the attack.

When declaring an area of effect attack, the attacking player must first choose how the weapon's pattern is applied by selecting a set of hexes that matches the diagram.

Targets must still be in range and within Line of Sight in order to declare an attack with an AoE weapon—unless the weapon ignores Line of Sight—but all AoE attacks ignore units and Garrisons when determining Line of Sight.

Once the attack pattern has been placed, all enemies within Line of Sight and contained within the chosen hexes are targeted simultaneously. The attacking player does not choose individual targets and may not exclude eligible enemies.

The RX-75 Guntank's Quad Bop Missile Launcher is an area of effect attack. The grey hex in the included diagram shows the RX-75 Guntank's position, while the red hexes show the area that will be affected by the attack. The "SP" in the attack's range value is another indicator that the attack has a special area of effect.

Engagement

While a unit is adjacent to an enemy unit or Garrison at the same elevation, it is considered Engaged. Engaged units must target at least one of the enemies they are Engaged with when

making any attack. Area of effect attacks that target multiple enemies are valid while Engaged as long as at least one of the Engaged enemies is included in the attack.

Attack Timing and Responses

Each attack follows the order below. Players can respond to attacks using cards and abilities at the times indicated, starting with the attacking player.

1. Declare that you're making an attack.
2. Choose an attack and check that you have range and a clear Line of Sight to your target(s).
3. Pay the Timeline cost of your attack.
4. Players may respond to the attack before dice are rolled with abilities that say Before Attack Roll.
5. Roll your attack dice.
6. Players may respond to the attack after dice are rolled with abilities that say After Attack Roll.
    a. The Disarm status effect triggers after the attacking player resolves any other After Attack Roll abilities they wish to use, then the Disarm effect is removed.
7. Resolve critical hit effects.
8. Deal damage to your target equal to the number of hits rolled minus any opposing Shields.
    a. The Fracture status effect triggers when damage is dealt.
    b. Units with 0 hit points after damage is dealt are defeated.
9. Players may respond to the attack after the attack deals damage with abilities that say After Combat Damage.

Each step in this process must be resolved before the next step begins. In the event that both players want to respond to an attack at the same time, the attacking player's abilities are resolved first, followed by the defending player.

Attack Rolls

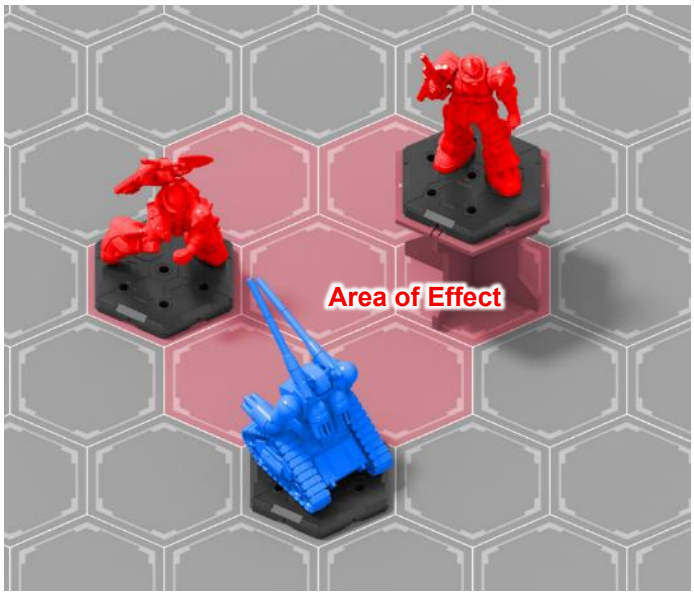

Each weapon has a Strength value indicating the number of 10-sided attack dice to roll during an attack with that weapon. Many abilities will modify the Strength of an attack by adding or subtracting from the number of dice rolled.

Once you've determined the number of dice needed, roll all attack dice simultaneously.

Attack Rolls with Additional Targets or Areas of Effect

Players will make a single attack roll when targeting multiple enemies with an area of effect weapon or another weapon that allows additional targets. Once the attack has been declared and targets have been confirmed, the attacking player rolls all attack dice simultaneously. Once

rolled, players will calculate hits from the roll for each target individually, accounting for terrain modifiers that might change Accuracy for some targets but not for others. (If the attack would receive Strength or Accuracy modifiers from abilities for some targets but not for others, those modifiers apply to all targeted units.) Once hits have been calculated, damage is applied to all targeted units simultaneously, but the damage dealt to each unit may differ depending on the number of successful hits and other factors that increase or reduce damage dealt to some targets but not to others.

Player A is attacking with the RX-75 Guntank. We saw previously that the RX-75 Guntank's Quad Bop Missile Launcher is an AoE attack. The red hexes represent the attack's area of effect. Both Char's Zaku II and the Zaku II: Minelayer are inside the area, and the RX-75 Guntank has a clear line of sight to both. Player A collects their attack dice and makes a single roll for the attack.

Once dice have been rolled, player A calculates the number of hits scored by the attack individually for each unit targeted. Since Char's Zaku II is on elevated terrain compared to the RX-75 Guntank, the attack receives -1 Accuracy against Char. Player A calculates the number of hits scored against Char before moving on to the Zaku II: Minelayer, which is at the same elevation as the RX-75 Guntank and does not receive an Accuracy modifier.

Player A is holding a Tactics card that would give their attack +2 Strength when attacking enemy units at a higher elevation. Char's Zaku II is on elevated terrain compared to the RX-75 Guntank, but the Zaku II: Minelayer is not. In this situation, Player A could play the Tactics card to gain +2 Strength on the entire attack, since the modifier applies to at least one of the units targeted.

Once the number of hits has been calculated for each targeted unit, an appropriate amount of damage is dealt to all targeted units simultaneously.

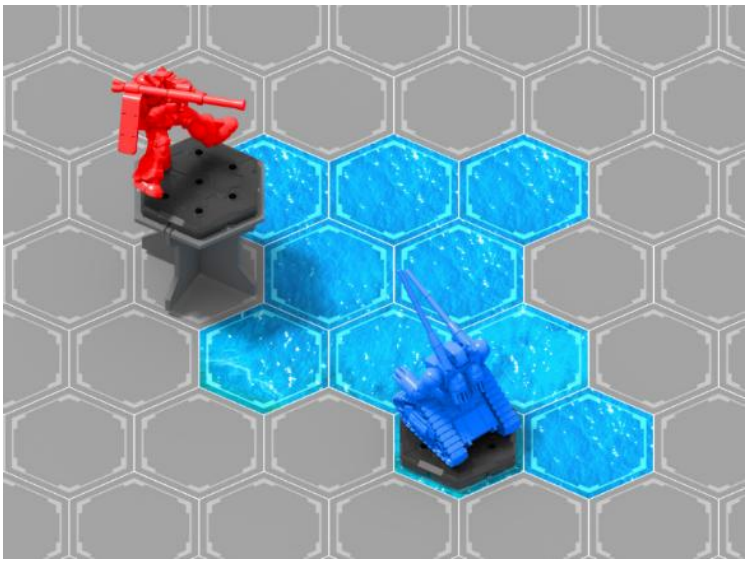

Hits, Misses, and Accuracy Modifiers

By default, every attack die rolled that results in a value of four or greater is considered a hit. There are many factors that can affect a unit's Accuracy, however, and these need to be taken into account when determining hits.

Any effect that raises or lowers a unit's Accuracy adds or subtracts from the value of their dice rolls by that amount, excluding rolls of 1, 9 or 10. +1 Accuracy adds one to each die roll, for example, while -1 Accuracy subtracts one from each die roll. Rolls of 1 are always considered a miss, regardless of Accuracy modifiers, and rolls of 9 or 10 are considered a critical hit. Accuracy modifiers do not turn lower rolls into critical hits. See "Critical Hits."

Elevation and Accuracy

Targeting a unit at a higher elevation results in -1 Accuracy, while targeting a unit at a lower elevation results in +1 Accuracy.

Player B is targeting the RX-75 Guntank with Char's Zaku II. By default, Player B needs to roll a four or greater on each attack die to score a hit. Because Char's Zaku II is on a higher elevation than the RX-75 Guntank, however, it gets +1 Accuracy, which increases the value of each die rolled by 1. The RX-75 Guntank is also in the water, though, and attacking a target in water confers -1 Accuracy. This will subtract from each of Char's Zaku II's rolls and counteracts the bonus from being on higher elevation.

Critical Hits

Any time a player rolls a 9 or 10 on one or more attack dice, they score a critical hit. Critical hits succeed against a target regardless of any Accuracy modifiers.

Additionally, all weapons have a critical hit effect that triggers when a player rolls a critical hit with that weapon. (Some critical hit effects require rolling multiple critical hits to activate.) Critical hit effects may raise a weapon's damage, inflict a status effect, destroy an enemy Upgrade, or any number of other effects.

Critical hit effects on weapons can only be activated once per attack, regardless of how many critical hits are rolled, unless otherwise specified by the effect.

Accuracy modifiers do not affect critical hit values; a player must still roll a 9 or 10 on one or more attack dice in order to score a critical hit, unless otherwise specified.

Damage and Shields

After you've determined the number of hits scored by an attack, you'll need to determine the amount of damage dealt. Each hit against an enemy target deals one damage, but some units may reduce incoming damage through the use of Shields. Each active Shield prevents one point of damage from an attack. Any remaining damage reduces the target unit's hit points.

Shields are applied against incoming damage after all other effects resolve. Cards and abilities that also reduce damage will do so before the damage impacts any Shields.

Critical hit effects apply even if Shields prevent all damage from an attack.

Some critical hit effects and other abilities will increase the amount of damage dealt by an attack. Effects and abilities that say an attack deals "Damage+[x]" increase the combat damage dealt by that attack by the value stated on the ability.

Defeated Units

When a unit's hit points are reduced to 0, that unit is defeated and the opposing player earns victory points equal to the defeated unit's victory point value. Remove the defeated unit from the board, return it to its owner's Reserve, and immediately move that unit's Timeline token two spaces forward on the Timeline track as a penalty. This represents the time it takes to repair a defeated unit. Reset that unit's hit points to their maximum value and remove any status effects present on the unit. Do not reset the unit's Energy or Upgrades. The next time that unit would

act, it must be redeployed following normal deployment rules. If a unit is defeated during its own activation, its activation ends immediately.

Cards and Abilities

Most of the units featured in Gundam Assemble possess unique abilities that can be used at various points during gameplay, and players will begin each game with a deck of Tactics cards that can likewise be played at various times. Each type of ability and its rules are described in the following sections.

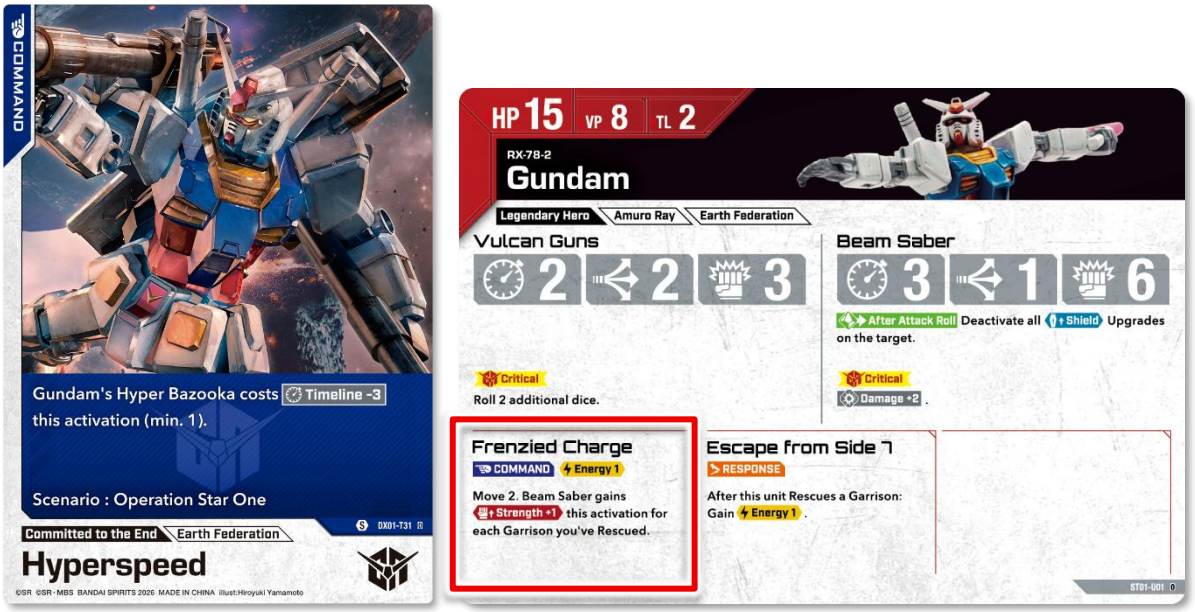

As a general rule, for abilities with multiple effects, players must resolve each effect entirely before moving on to the next effect, and must resolve effects in the order printed.

Abilities and effects that say a unit can't do something take precedent over abilities and effects that allow a unit to do something.

Command Abilities

Command abilities can only be used while activating a unit, and each can be used only once per activation. For Command abilities printed on unit cards—or for Tactics cards featuring the name of a specific unit—you must be activating the unit in question to use those cards or abilities.

Command abilities may not be used in the middle of another action unless otherwise specified by the ability.

Response Abilities

Response abilities are used in response to a specific situation or trigger, stated on the card or ability.

Responses may be used as soon as the stated conditions are met, regardless of which player is currently acting or what actions are currently being resolved. When a Response is triggered, resolve its effect entirely before resuming other actions.

Players may respond to a single trigger with a combination of cards and abilities if able, and may use the same response ability multiple times during an activation if responding to separate triggers, but may not respond to a single trigger with the same ability multiple times.

Areas of effect or other attacks targeting multiple units create separate triggers for each unit included in the attack.

Duel Gundam is attacking the Gundam RX-78-2 and the RX-77-2 Guncannon with its Grenade Launcher area of effect attack. The Duel Gundam's ally, Oggo, is positioned nearby where it can use its Artillery Support Response ability to deal additional damage. While the Duel Gundam's attack damages both the RX-78-2 Gundam and RX-77-2 Guncannon at the same time, each unit damaged by the attack acts as a separate trigger for the Oggo, allowing it to use its Artillery Support to deal additional damage to both targets.

The player currently activating a unit must decide first whether or not to respond to a trigger.

Attack Abilities

Some abilities allow a player to make an attack with a unique weapon. These abilities take the place of a unit's Primary Attack Action, meaning they can't be used during the same activation

the player made a standard attack unless otherwise specified by the ability. These abilities typically include a Timeline cost that must be paid when using the ability.
Some abilities allow units to make additional attacks with weapons already printed on the unit card. These are in addition to the unit's Primary Attack Action unless otherwise specified.

For attack cards featuring the name of a specific unit, you must be activating the unit in question to make that attack.

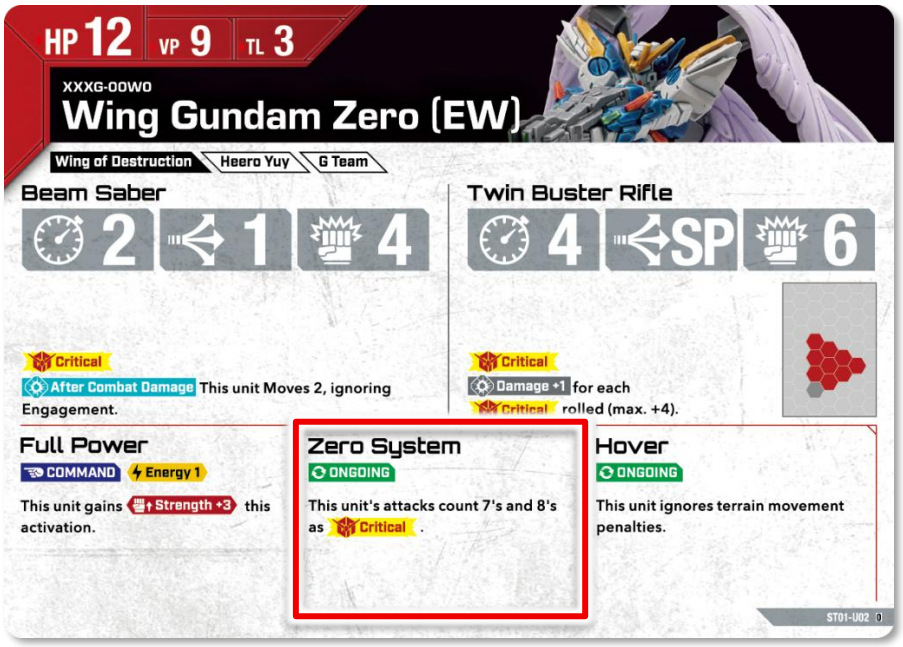

Player A decides to play "Epic Shot" while activating the RX-78-2 Gundam. This card replaces the RX-78-2 Gundam's Primary Attack Action for this activation. The RX-78-2 Gundam will make an attack with its Beam Rifle as described by the card, spending the necessary TL for making the attack and carrying out the attack resolution as normal.

Ongoing Abilities

Ongoing abilities are active from the outset of the game. These abilities do not require Energy and do not need to be activated.

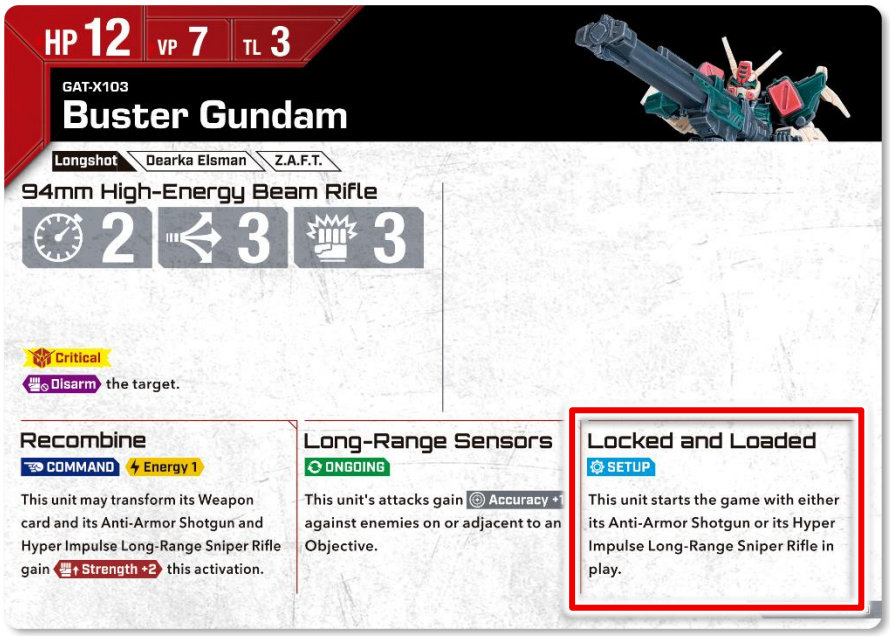

The XXXG-00W0 Wing Gundam Zero (EW), for example, scores critical hits when rolling 7's or 8's due to it's "Zero System" ability.

Setup Abilities

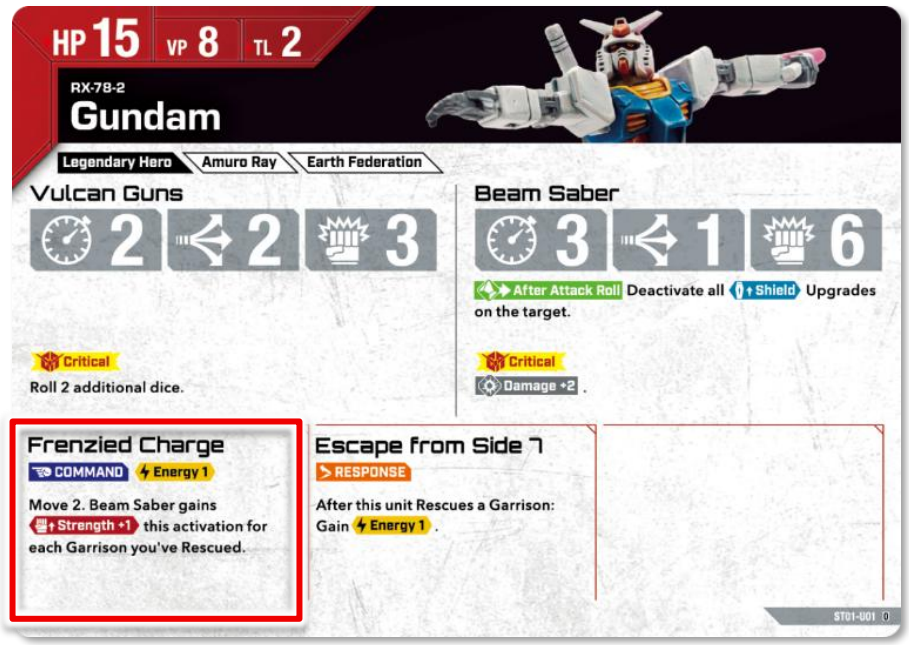

Setup abilities are resolved while players are setting up the game, before the game begins. Resolve these abilities in order starting with the first player to act. If a player possesses more than one setup ability, resolve those abilities in any order.

The Buster Gundam, for example, starts the game with a special Weapon card in play.

Abilities Requiring Energy

Many abilities require a player to spend Energy, which can be acquired in a variety of ways. These abilities can be used during the same activation the Energy is acquired, but the Energy must be spent by the unit activating the ability.

Player A is currently activating the RX-78-2. During the RX-78-2 Gundam's last activation, player A used the Energize Primary Action to give the RX-78-2 Gundam 1 Energy. This activation, they want to use the RX-78-2 Gundam's "Frenzied Charge" ability. "Frenzied Charge" is a Command ability that requires Energy. Player A must spend the RX-78-2 Gundam's Energy during their activation to activate the ability.

Ending your Activation

Once you've finished taking actions with your current unit, your activation is over. Once all units that can act during a given round have been activated, the round is over and play moves to the next round.

Status Effects

Many abilities allow players to apply status effects to allies or enemies. These effects are represented by adding a corresponding status effect token to the appropriate unit card. Status effects only affect units and Carriers, and each unit may only have one instance of a given status effect at a time.

Disarm

The next time a Disarmed unit makes an attack, it must re-roll all attack dice that result in a hit and cannot trigger critical hit effects during that attack. Disarm is triggered during the 

resolution step, after the attacker resolves any other abilities they wish to use during that timeframe. Remove this status effect immediately after re-rolling Attack dice.

Fracture

The next time a Fractured unit would take three or more combat damage from a single attack, they take an additional three damage instead. The additional damage from Fracture is triggered immediately when damage is dealt by the attack and is considered part of the attack damage. Remove this status effect after the additional damage is dealt. Note that Fracture only affects attack damage. Direct damage dealt by abilities will not trigger the additional damage from Fracture.

Slow

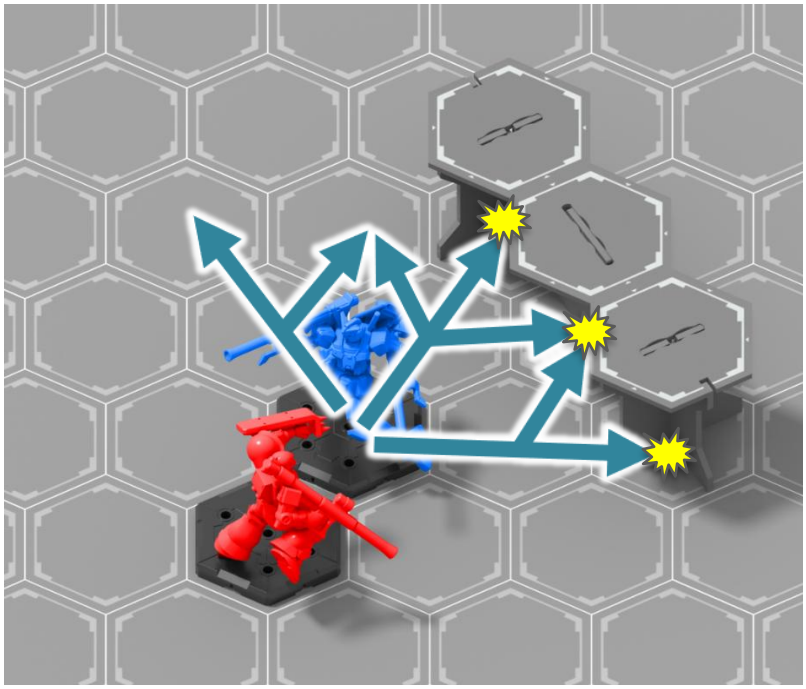

The next time a Slowed unit Advances, it does not move. Remove this status effect after the unit's Advance action. Slow does not affect Dashing or other means of moving during your activation.

Other Special Effects

Push

Some abilities and effects allow a unit to Push an enemy. When an enemy is Pushed, follow these steps:

- Move the affected enemy **away** from the source of the Push up to the number of hexes indicated by the ability. Push 1, for example, moves an enemy one hex. Movement penalties caused by Engagement and terrain do not affect Push.
    - Enemies cannot be Pushed onto a higher elevation. Instead, they collide with the terrain and take collision damage.
- Each hex a Pushed enemy moves to must be further away from the source of the Push than the previous hex. Count the number of hexes between the source and the target to determine if the target has moved further away.
- If an enemy moved by Push would collide with a piece of terrain or another ally or enemy, stop moving the enemy and instead all allies and enemies involved take 2 damage and the Push ends.

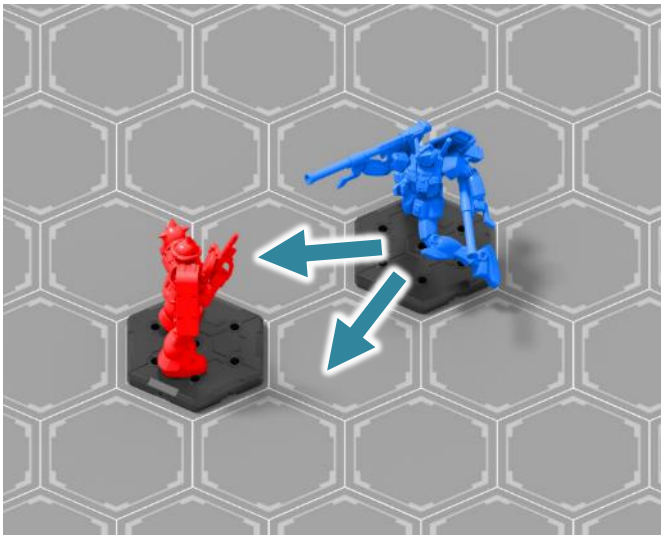

Player B attacks the RX-78-2 with Zaku's I Knuckle Shield and scores a critical hit. The critical hit effect on the Knuckle Shield is Push 2, allowing Player B to Push the RX-78-2 Gundam up to 2 hexes. The image above shows the various directions that Player B could choose to move the RX-78-2 Gundam. Four of the available paths would knock the RX-78-2 Gundam into elevated terrain, in which case it would take 2 collision damage.

Pull

Some abilities and effects allow a unit to Pull an enemy. When an enemy is Pulled, follow these steps:

- Move the affected enemy **toward** the source of the Pull up to a number of hexes indicated by the ability. Pull 1, for example, moves an enemy one hex. Movement penalties caused by Engagement or terrain do not affect Pull.
    - Enemies cannot be Pulled onto a higher elevation. Instead, they collide with the terrain and take collision damage.
- Each hex a Pulled enemy moves to must be closer to the source of the Pull than the previous hex. Count the hexes between the source and the target to determine if the target has moved closer.
- If an enemy moved by Pull would collide with a piece of terrain or another ally or enemy, stop moving the enemy and instead all allies and enemies involved take 2 damage.
- An enemy that is already adjacent to you at the same elevation cannot be Pulled.

This time player B has played a Tactics card allowing Char's Zaku II to Pull the RX-78-2 Gundam up to one hex. If Player B decides to Pull the RX-78-2 Gundam (which is always optional) they must Pull it toward Char's Zaku II following the shortest possible path. In this instance, there are actually two paths that are equally short, and so either of the hexes in this example would be eligible for Pulling in the RX-78-2 Gundam.

Upgrades

Many abilities present in the game (as well as the Upgrades placed on the board) allow players to upgrade the capabilities of their units. These Upgrades are represented by putting an appropriate Upgrade token on the corresponding unit card.

Collecting Upgrades and Energy on the Map

When a unit ends any movement action in a hex containing an Upgrade or Energy, immediately place that Upgrade or Energy on the unit card belonging to the unit that collected it. Units must end their movement in order to collect Upgrades or Energy; simply moving through the hex is not sufficient.

Shield Upgrades

Shield upgrades provide units with Shields to deflect incoming attacks. Whenever a unit would take damage, if it has an active Shield, prevent one damage for each active Shield and then flip the corresponding Shield Upgrades face down. Face down Shields are deactivated and will not prevent damage. At the start of a unit's next activation, flip any Shield Upgrades face up to reactivate them.

Shields are applied to prevent damage after all other effects are resolved. Abilities that reduce the amount of damage dealt to a unit will reduce damage before it affects Shields.

Speed Upgrades

Speed Upgrades improve a unit's Advance action. When Advancing, a unit may move a number of additional hexes equal to the number of Speed Upgrades on that unit.

Strength Upgrades

Strength Upgrades increase a unit's Strength for the remainder of the game. Any attack made by a unit with Strength Upgrades will receive additional attack dice equal to the number of Strength Upgrades it possesses.

Redistributing or Taking Upgrades or Energy

Some abilities allow units to redistribute Upgrades or Energy between units, or to take an Upgrade or Energy from an enemy. When this occurs, transfer the Upgrade or Energy tokens between unit cards as necessary. Shield Upgrades are reactivated when redistributed or taken.

Elevation and Special Terrain

Elevation

Most Gundam Assemble scenarios feature terrain at differing elevations. As noted previously, the lowest point of elevation on a map is considered ground level, and each tier of higher elevation is numbered in relation to ground level.

Elevation has the following effects on gameplay:

- Moving from a hex at a lower elevation to a hex at a higher elevation costs one additional movement for each level of elevation gained. See "Movement Modifiers."
- When moving while on elevated terrain, units may Jump. See "Jumping."
- Attacking an enemy at a lower elevation than the attacker grants +1 Accuracy, while attacking an enemy at a higher elevation than the attacker grants -1 Accuracy.

Special Terrain

Battles throughout the Gundam universe have taken place in every imaginable locale—from sun scorched deserts and dense, tangled jungles to the crushing depths of the ocean and the vast silences of space. Gundam Assemble recreates these environments with specialized terrain that affects gameplay.

Water

- When moving.
    - Units receive a -1 hex penalty to any move action initiated while in water.

- When attacking.
    - Units receive a -1 Accuracy penalty when attacking enemy units in water.
    - Units receive a -1 Accuracy penalty when attacking from water.
    - Collectively, if both the attacker and the target are in water, the attack receives -2 Accuracy.

Impassable Terrain

- When moving.
    - Units may not move through hexes containing Impassable Terrain unless they have Hover.
    - No unit may end their movement in these hexes.

Debris Fields

- When moving.
    - Units receive a -1 hex penalty to any move action initiated while in a debris field.

- When attacking.
    - Units receive a -1 Accuracy penalty when attacking enemy units in a debris field.
    - Units receive a -1 Accuracy penalty when attacking from a debris field.
    - Collectively, if both the attacker and the target are in a debris field, the attack receives -2 Accuracy.

Minovsky Particles

- When attacking.
    - Units receive a -2 Accuracy penalty while inside Minovsky Particles when making any attack against a non-adjacent target.
    - Units receive a -2 Accuracy penalty while outside Minovsky Particles when making any attack against a non-adjacent target that is inside the Minovsky Particles.
    - The Accuracy penalties from Minovsky Particles are not cumulative, so units will only receive -2 Accuracy if both the attacker and the defender are inside the Minovsky Particles.

Setting up Terrain

Some scenarios allow players to place terrain however they want when setting up the board. For these scenarios, players must agree during setup how and where they want to place terrain.

Squad and Deck Building

Building your Squad

One of Gundam Assemble's most exciting prospects is the ability to mix and match units from across the franchise to create the teams you've always dreamed of. The number of units you'll need to include in your squad is dictated by your chosen scenario. Most scenarios require squads of either three or five units, and some scenarios will also include a Carrier.

Once you've identified how many units you need, squad building is simple. Select any units of your choice. There is only one restriction: you cannot include multiple copies of a unit with the exact same unit card number in your squad unless those units are Mass Produced. Many units will benefit from being paired with their typical comrades—Zeon forces favor playing with other Zeon, for example—but there is no inherent rule preventing any combination unless specified by your chosen scenario.

Multiple Copies of Mass Produced Units

Mass Produced units allow players to include multiple copies of the same unit within their squad. When players choose to use multiple copies of a Mass Produced unit, though, they must take adequate steps to ensure that each unit—and its corresponding Timeline token—are easily distinguishable and relatable to their corresponding unit card. Players can use a variety of methods to distinguish their units and Timeline tokens, whether that be through paint color schemes, unique additions to model bases, or other methods, but it must be clear which Timeline token is associated with each unit and each unit must be distinguishable from other units of the same unit card number.

Building your Deck

In addition to building a squad, players will build a deck of exactly nine Tactics cards. While squad building is almost entirely open-ended, the makeup of your squad has a profound impact on deck building. Players must adhere to three rules when building their Tactics deck.

- Each unit has a Signature Tactics card that can only be used by that unit. These cards will feature the signature title of the unit to which they belong, and can only be included in your deck if your squad contains the unit with the matching title.
- Some Tactics cards include specific traits, such as **Earth Federation** or **Zeon**. For these, you may only include the card in your deck if your squad includes at least one unit with a matching trait.

- Players may only include one copy of each card in their Tactics deck.

Targeting Restrictions

In addition to having to include units with specific titles or traits in your squad in order to include certain cards in your deck, many Tactics cards will only target units with a specific name or trait. These targeting restrictions will be detailed clearly in the card's effect text. In the case of Signature Tactics cards that call out a unit by name, the unit named by the card must be an allied unit and must also have the matching signature title.

Player A has included both the RX-78-2 Gundam, Legendary Hero and the RX-78-2 Gundam, Elite Mobile Suit in their squad. During their turn, they intend to play the Signature Tactics card Epic Shot. This card features the signature title Legendary Hero. As a result, even though both units are named "Gundam" and the effect text says that "Gundam makes the following attack…" the card can only be used in combination with the Gundam, Legendary Hero.

In the event Player A's opponent was also playing with the RX-78-2 Gundam, Legendary Hero, Epic Shot would only be playable on the Legendary Hero belonging to Player A.

Other Tactics Deck Rules

The nine cards contained in a player's Tactics card deck are finite. Players will draw three cards at the start of the game and another three at the end of Phase 1, leaving three remaining in their deck. Some effects will allow players to draw additional cards during gameplay. In the event that a player's Tactics card deck runs out of cards, that player may no longer draw additional cards.

In the event players want to play beyond two Phases, players must add three additional Tactics cards to their deck for each Phase they want to play beyond two. In a three Phase game, players will have 12 card decks. In a four Phase game, 15 card decks, and so on.

Units with Unique Components

Many units in Gundam Assemble come with unique tokens or other components that facilitate their individual attacks and abilities. These units will specify the name and number of components that they come with as part of their unit card, and will often come with additional cards detailing the unique rules and abilities of each component. Following are a few general rules that apply to units with unique components.

- Components that come with a unit begin the game in that unit's supply.
- Units with unique components will specify the number of components they possess and cannot possess more than the number stated on their unit card.
- Many units will deploy their unique components to the board in one fashion or another. To deploy a component, take the corresponding token from the unit's supply and place it on the board following the rules specified by the unit deploying the component.
- When a component deployed to the board is destroyed or removed for any reason, return it to the supply of the unit that deployed it.
- Units cannot deploy additional components if there are none remaining in the unit's supply.

Carriers

Some Gundam Assemble scenarios will ask players to select a Carrier—such as the iconic White Base or Char's Musai-class battleship—to include as part of their squad. Players must observe the following rules when playing with Carriers.

Selecting Carriers

Players may select any Carrier of their choice when building a squad for use in scenarios involving Carriers unless otherwise specified by the scenario.

Activating Carriers

Carriers are activated exactly like units during their activation and follow all standard rules for units with a few adjustments and exceptions, outlined below.

Deploying from Carriers

Carriers typically replace Bases in scenarios that feature them, and in these situations players will deploy their units from their Carrier. When deploying from a Carrier, place the deployed unit

adjacent to the middle-hex of the Carrier and activate it immediately. The elevation of the hex where you deploy the unit does not matter.

Moving Carriers

When moving a Carrier, a player must first determine if they wish to begin their movement from the front or back hex of the Carrier. After declaring which section of the Carrier will move first, players will move the Carrier one hex forward in any direction. The middle hex of the Carrier must then move to occupy the hex vacated by the section that just moved. Players may need to rotate the body of their Carrier in order to achieve this. Continue moving the Carrier one hex at a time in this fashion until you've moved your maximum distance or you wish to end your movement.

Carriers ignore all units, Garrisons, and terrain penalties when moving, but cannot end their movement in hexes containing units or Garrisons and must end their movement with all hexes of the Carrier on the same level of elevation.

Carriers do not cause Engagement and cannot be Engaged.

Carriers cannot be moved by abilities or effects. This means they cannot be affected by Push or Pull and cannot be moved using abilities or Tactics cards that allow movement.

Attacking with Carriers

Carriers measure their range and Line of Sight from the front hex of the Carrier, and their Line of Sight is blocked by any other hexes containing parts of the Carrier.

Disabling Enemy Carriers

Carriers have hit point and victory point values exactly like units and may be attacked and defeated following the standard rules. When a Carrier is defeated, however, it becomes disabled. Disabled Carriers are not removed from the board and will not redeploy. Instead, remove the Carrier's Timeline token from the Timeline track and the Carrier can no longer be activated. Players may still deploy units from disabled Carriers.

Disabled Carriers still block movement and Line of Sight but no longer contest Objectives.

Carriers and Unique Terrain

Because Carriers occupy multiple hexes, there may be situations where a Carrier is partially in water, Minovsky Particles, or other unique terrain types and partially out of those terrain types at the same time. In these situations, apply the effects of the terrain only to the parts of the Carrier that are inside that terrain.

For example: Carriers measure their range and Line of Sight from their front hex. If the center and back hexes of a Carrier are inside Minovsky Particles but the front hex is not, the Carrier won't receive an accuracy penalty when making a ranged attack, even though part of the carrier is inside the particles. Similarly, a unit targeting the front hex of the Carrier won't receive an accuracy penalty either, as the part of the Carrier being targeted is outside of the particles.

Scenarios, Goals, and Victory Points

Each game of Gundam Assemble revolves around a specific scenario. Some scenarios offer open-ended skirmish opportunities, while others recreate historic battles from the Gundam universe. Players begin the game by agreeing on the scenario they wish to play and placing any relevant scenario goal cards in the play space alongside other components.

Goals

Each scenario includes some number of scenario goals representing specific tasks players can complete to earn victory points. Each scenario describes both the conditions necessary to complete the goal and the number of points earned.

Some goals correspond to a specific Phase and can only be achieved during that Phase, while others are active for the duration of a game and will score at the end of each Phase.

Scenario Tokens

Some scenarios will include standardized tokens that have different functions depending on the scenario being played. Refer to the scenario instructions for your chosen scenario for information on how to set up and use these tokens.

Victory Points (VP)

Players will earn victory points throughout the course of the game by defeating enemy units and Garrisons, rescuing allied Garrisons, and by completing scenario goals. The player with the most victory points at the end of a game is considered the winner. In the event of a tie, the last player to act during the game wins. Below is a quick reference for the amount of victory points earned for various actions.

- When you defeat an enemy unit: Gain victory points equal to that unit's VP value.
- When you defeat an enemy Garrison: Gain two victory points.
- When you Rescue an allied Garrison: Gain two victory points.
- At the end of each Phase: Gain victory points for each Objective you control and other scenario goals as dictated by your scenario.

Garrisons

Most Gundam Assemble scenarios include Garrisons. These represent each player's auxiliary forces: soldiers, tanks, planes, and other elements of a player's army. Players can interact with Garrisons in a variety of ways.

Attacking Garrisons

Enemy Garrisons can be attacked and defeated to earn victory points. Each Garrison has a single hit point and can be attacked in the same way as an enemy unit, though they do not count as units for the purposes of effects that specifically target an enemy unit. (Garrisons can also be defeated by abilities that deal damage directly if those abilities are not limited to targeting enemy units.) Once a Garrison is defeated, remove it from the board and gain two victory points.

Rescuing Garrisons

Allied Garrisons can be rescued to earn victory points. To rescue a Garrison, a player must spend two Timeline while their active unit is adjacent to the Garrison they wish to Rescue. Once Rescued, remove the Garrison from the board and gain two victory points.

Garrisons, Line of Sight, Movement, and Engagement

Enemy Garrisons block Line of Sight, movement, and cause Engagement in the same way as an enemy unit, though they do not count as an enemy unit for purposes of effects or abilities that specifically target enemy units.

Controlling Objectives

Many scenario goals require players to control key Objectives on the battlefield to score victory points. These Objectives begin the game in a neutral state (not controlled by either player) and become controlled by players as the game progresses.

When a unit ends its activation on or adjacent to an Objective, that unit **contests** the Objective.

When a unit contests an Objective:

- If the number of allied units on or adjacent to that Objective is **greater** than the number of enemy units similarly positioned, that contest succeeds.

When a unit succeeds in contesting an Objective:

- If the Objective is neutral, the contesting player captures the Objective.
    - Take one of the double-sided control tokens and place it on top of the Objective with the matching color face up.

- If the Objective is controlled by the opposing player, remove that player's control token and return the Objective to neutral.

Once you gain control of an Objective, it remains under your control until the opponent wins a contest following the rules above. You don't have to remain adjacent to the Objective to retain control.

Abilities that allow units to move outside of their normal activation do not allow those units to contest Objectives unless otherwise specified. Units only contest Objectives when ending their own activation on or adjacent to the Objective.

Capturing Objectives

Some effects allow a unit to **capture** an Objective. When a unit captures an Objective, they ignore the rules for contesting and take control of the Objective immediately, regardless of enemy units or the state of the Objective.

Picking up Objectives

Some scenarios have Objectives—such as civilians or crucial technology—that can be picked up and carried by a Mobile Suit or other unit. These Objectives work similarly to Upgrades; when a unit ends its movement on top of the Objective, they pick it up. Once an Objective has been picked up, place the corresponding token on the unit card of the unit that picked it up.

When a unit carrying an Objective Dashes or is Pushed or Pulled, it drops the Objective it was carrying on the hex it occupied when it Dashed or was Pushed or Pulled.

Objectives carried by a unit are also dropped if that unit is defeated. When a unit carrying an Objective is defeated, place the Objective token in the hex containing the unit after removing that unit from the board.

Glossary

Ability: All units possess some number of abilities printed on their unit card. Some abilities require Energy to use. Abilities require Line of Sight unless otherwise specified. Effects granted by Tactics cards are also considered abilities.

Accuracy: Any effect that raises or lowers a unit's Accuracy adds or subtracts from the value of their dice rolls by that amount, excluding rolls of 1, 9 or 10. +1 Accuracy adds one to each die roll, for example, while -1 Accuracy subtracts one from each die roll. See "Hits, Misses, and Accuracy Modifiers."

Additional: Some abilities allow a unit to take an additional action, such as Advancing, Attacking, Dashing, or Rescuing. These are in addition to the unit's Primary Actions.

Advance: Advancing is a unit's standard move action. A unit may move up to three hexes when Advancing. Some cards and abilities will also allow a unit to Advance. These effects are in addition to a unit's normal Advance action. See "Advance."

Ally (or allied): An ally refers to a unit, Garrison, Remote Weapon System, or structure that belongs to you.

Area of Effect: Some weapons and abilities affect a pre-defined area, rather than a single target. Weapons and abilities with an area of effect will include a diagram indicating the position of the acting unit and the area affected by the attack or ability. See "Area of Effect Attacks."

Attack: Attacking is one of the Primary Actions a unit can take during its activation. When a unit makes an attack, it must choose both a weapon to attack with and a target for the attack. See "Attacking."

Attack Dice: When making an attack, a player rolls a number of attack dice equal to the Strength of the weapon being used, plus or minus any modifiers.

Away: Some effects allow or require a unit to move away from another unit or object. In this case, each hex moved must be further away from that unit or object than the previous hex, as determined by counting the number of hexes between the unit moving and the unit or object you're moving away from.

Battlefield: The battlefield consists of all hexes printed on the game board. Units currently on the game board are considered to be on the battlefield. Units in a player's Reserve are not on the battlefield.

Capture: When a unit captures an Objective, the capturing player gains control of that Objective immediately, regardless of the number of allied or enemy units adjacent to the Objective or the Objective's current state.

Carrier: Some scenarios will include a Carrier as part of each players' squad. Carriers are considered units and follow most of the same rules, with some exceptions. See "Carriers."

Challenge: The Challenge ability allows a unit to swap with an ally in order to become the target of an attack. When this occurs, exchange the positions of each miniature or token involved in the swap and treat the Challenge unit as the target of the attack.

Collision Damage: Push and Pull effects can result in a unit, Garrison, or Remote Weapon System (RWS) colliding with another unit, Garrison, Remote Weapon System, Carrier, structure, or piece of terrain. When an ally or enemy collides with a structure or a piece of terrain, it takes 2 damage. When an ally or enemy collides with another ally or enemy, all parties take 2 damage. Allies or enemies that are defeated by an attack or ability that also Pushes or Pulls will still collide. Collision damage is prevented by Shields.

Combat Damage: All damage dealt by resolving hits from attack dice, critical hit effects that modify attack damage, and damage applied by Fracture is considered combat damage.

Command: The term command refers to Command abilities, which can only be used while activating a unit.

Contest: When a unit ends its activation on or adjacent to an Objective, it contests that Objective. Contesting Objectives allows players to gain control of them in order to score victory points. See "Objectives."

Critical Hit: Any time a player rolls a 9 or 10 on one or more attack dice, they score a critical hit. Critical hits succeed against a target regardless of any Accuracy modifiers and trigger a weapon's critical hit effect. See "Critical Hits."

Dash: Dashing is one of the Primary Actions a unit can take during its activation. Dashing allows a unit to move up to two hexes for the cost of two Timeline. See "Dash."

Deactivated: When a Shield prevents damage, it becomes deactivated. Deactivated Shields cannot prevent further damage and are re-activated the next time the unit possessing them is activated. Some abilities may also deactivate Shields.

Defending: A unit targeted by an enemy attack is considered defending.

Deploy (and Redeploy): The first time you activate a unit, it must be deployed from either a Base or Carrier. The first time you activate a unit after it has been defeated, it must be redeployed from either a Base or Carrier. See "Deploying your Units."

Disarm: A unit that has been Disarmed must re-roll all attack dice that result in a hit during its next attack and cannot trigger critical hit effects during that attack. Disarm triggers

, after the attacker resolves any other abilities they wish to use during that timeframe. See “Status Effects.”

Empty Hex: An empty hex is a hex that contains no units, Garrisons, Remote Weapon Systems (RWS), structures, or other tokens of any kind.

Enemy: An enemy refers to a unit, Garrison, Remote Weapon System, or structure that belongs to the opposing player.

Energize: Energizing is one of the Primary Actions a unit can take during its activation, allowing it to gain 1 Energy for the cost of two Timeline.

Engaged: While an allied unit is adjacent to an enemy unit or Garrison at the same elevation, it is considered Engaged. Engaged units receive a -1 hex penalty to any movement action initiated while Engaged and must target at least one of the enemies they’re Engaged with when making an attack. See “Engagement.”

Fracture: The next time a Fractured unit would take three or more combat damage from a single attack, it takes an additional three damage instead. Fracture triggers immediately when damage is dealt by an attack. See “Status Effects.”

Fueled: Each time a Fueled unit deploys, it gains 1 Energy.

Garrison: Most Gundam Assemble scenarios will instruct players to place Garrisons on the map. Allied Garrisons can be rescued to earn victory points, while enemy Garrisons can be defeated for the same purpose. Garrisons block movement, Line of Sight, and cause Engagement as if they were units. See “Garrisons.”

Hit Points: Units, Garrisons, Remote Weapon Systems, and Carriers all have some number of hit points, which are depleted when they take damage. When an ally or enemy’s hit points are reduced to zero, they are defeated.

Hover: Units with Hover ignore terrain and elevation penalties while moving.

Impassable Terrain: Units cannot move through Impassable Terrain unless they have Hover. No unit may end its movement in a hex containing Impassable Terrain.

Jump: When a unit begins a move on elevated terrain, it may Jump. Jumping allows units to bypass intervening terrain and enemies at lower elevation. See “Jumping.”

Line of Sight: Players must have a clear Line of Sight in order to make an attack or use an ability with a defined range. Line of Sight is determined by drawing a line from the center of the active unit’s hex to the center of the target’s hex. Allied units, Garrisons, and structures do not

block Line of Sight. Enemy units, Garrisons, and structures block Line of Sight only when they are at the same elevation as both the attacker and the target. See “Line of Sight.”

Mass Produced: Players can include any number of Mass Produced units with the same unit card number in their squad, up to the number of units specified by their scenario.

Move: Some abilities allow players to move a unit or Garrison. These abilities are considered movement actions but are not the same as Advancing or Dashing. These abilities will specify how far to move and this distance is affected by enemies and terrain like any other movement. Movement is always optional, and players do not have to move the full distance allowed.

Movement Types: All of the following effects are considered movement and can trigger abilities that depend on movement.

- Advance.
- Dash.
- Move.
- Pull. (Typically initiated by your opponent and ignores typical movement modifiers.)
- Push. (Typically initiated by your opponent and ignores typical movement modifiers.)
- Reposition (caused by some abilities).
- Swap (caused by some abilities).

Non-Combat Damage: All damage dealt outside of an attack or by an effect that is not the result of resolving hits from an attack, critical hits that modify attack damage, or Fracture is considered non-combat damage. This includes collision damage.

Ongoing: Ongoing abilities are active at the start of the game and remain so until the game is completed.

Phase: Each game of Gundam Assemble includes two Phases, each of which consists of 10 rounds. Players will score victory points at the end of each Phase as dictated by the scenario.

Pull: A unit affected by Pull is moved toward the source of the Pull up to the number of hexes specified by the effect. This movement is not affected by typical movement modifiers. An enemy that is already adjacent to you at the same elevation cannot be Pulled. Pull can cause collision damage. See “Pull.”

Push: A unit affected by Push is moved away from the source of the Push up to the number of hexes specified by the effect. This movement is not affected by typical movement modifiers. Push can cause collision damage. See “Push.”

Range: All weapons have a range value. A weapon cannot be used to make an attack beyond its stated range. Many abilities also have a stated range that players must take into account. Attacks and abilities with a stated range also require a player to have Line of Sight to their target. See “Range.”

Reinforcements: Some units are able to deploy Reinforcements to the battlefield. When this occurs, tokens are placed both on the board and on the Timeline track to represent the new unit. Reinforcements are considered units. When a Reinforcement is defeated, remove the token from the game board and remove the corresponding Timeline Token from the Timeline. Reinforcements cannot be redeployed.

Remote Weapon System (RWS): Some units come equipped with abilities that allow them to deploy Remote Weapon Systems to the battlefield. These abilities and the abilities of the systems themselves are described on the relevant unit and Remote Weapon System cards. Remote Weapon Systems obey the following rules:

- RWS may only deploy or reposition to an empty hex.
- RWS do not block Line of Sight or movement.
- Units may not end their movement in the same hex as an RWS.
- RWS do not count as units, do not cause Engagement, and do not count when contesting Objectives.
- RWS can be attacked and destroyed.
- RWS can be Pushed or Pulled and cause collision damage.
- RWS cannot be affected by status effects.
- When an RWS is destroyed, it returns to the supply of the unit that deployed it and may be deployed again during a future activation.
- Units cannot deploy more RWS than they have available in their supply.

Repair: When a unit Repairs, it gains a number of Hit Points up to the amount specified by the ability. Units cannot gain more than their maximum number of Hit Points.

Reposition: Some abilities allow a player to reposition units, Garrisons, or Remote Weapon Systems. When a player repositions something, remove the object from its current hex on the board and place it on a new hex as directed by the ability causing the repositioning. Repositioning is considered a movement action.

Reserve: Players begin with their units off the board, in their Reserve, and units return to a player's Reserve when defeated. Units in a player's Reserve cannot be targeted by attacks or gain status effects, and some abilities printed on those units may not be active until they are deployed.

Response: Response abilities can only be used in response to a specific situation or trigger specified by the ability. When a player uses a Response ability, resolve the ability in its entirety before resuming other actions.

Round: Resolving a single space on the Timeline track is considered a round. There are 10 rounds in each Phase of gameplay. The number of players that act during a round is dependent on the position of units on the Timeline.

Scenario Goals: All Gundam Assemble scenarios will have some number of scenario goals that players can complete during gameplay. Refer to your chosen scenario for details on its scenario goals. See "Scenarios, Goals, and Victory Points."

Setup: Setup abilities affect the game during the setup phase. Resolve these abilities in order beginning with the first player to act during the game.

Shield: Each Shield a unit possesses prevents one damage from an attack or ability. Shields become deactivated when they prevent damage and will not prevent further damage until reactivated. Deactivated Shields are reactivated the next time the unit possessing them is activated.

Signature Tactics Cards: Each unit comes with a Signature Tactics card that can only be used by that unit. The unit named on the card is considered the source of any effects produced by these cards.

Speed: Upgrades and effects that increase Speed increase how far a unit can move when Advancing. A unit can move one additional hex for each point of Speed.

Squad: A player's squad includes all units and Carriers they intend to use during gameplay.

Slow: The next time a Slowed unit Advances, it moves 0 hexes instead. See "Status Effects."

Status Effects: Many cards and abilities apply status effects to their target, represented by corresponding status effect tokens. Status effects may only affect units, they do not affect Garrisons or Remote Weapon Systems. See "Status Effects."

Strength: Each weapon has a Strength value indicating the number of attack dice to roll when making an attack with that weapon. See "Attacking."

Structure: Many scenarios will include Bases or other structures belonging to one or both players. Rules for structures other than Bases will be provided with each specific scenario. In general, enemy structures block both movement and Line of Sight unless otherwise specified.

Swap: Some abilities allow units to swap with each other. When this occurs, exchange the position of each miniature involved in the swap. Swapping is considered a movement action.

Terrain Movement Penalties: The term 'terrain movement penalties' refers both to the movement penalty imposed by going up in elevation and to movement penalties caused by special terrain types like water.

Timeline Penalty: When a unit is defeated, it immediately moves two spaces up on the Timeline track as a penalty, representing the time needed to repair the unit before it returns to battle.

Trait: All units have one or more traits indicating their pilot, faction affiliation, or other unique characteristics. These traits are referred to by abilities and used to determine which Tactics cards a player can include in their deck.

Unit: A unit refers specifically to a Mobile Suit, Carrier, or other combatant with a unit card. It does not refer to Garrisons or Remote Weapon Systems (RWS).

Upgrade: Most scenarios feature Upgrades placed in hexes around the game board. Collecting these will allow players to improve the capabilities of their units. See “Upgrades.”

Victory Points: Defeating enemy units and Garrisons, Rescuing allied Garrisons, controlling Objectives, and completing scenario goals will all award victory points. The player with the most victory points at the end of a game is considered the winner. Each unit has a victory point value denoting how many victory points it’s worth when defeated. See “Scenarios, Goals, and Victory Points.”
